Pilkington Planar™ System Information
Pilkington Planar™ Laminated Insulating Glass Units (IGUs)

Pilkington Planar™ Laminated IGUs
Performance of typical combinations with clear interlayer

* Using PVB Interlayer
Please note that these are a selection of Solar Control glasses within the range and the performance data supplied is indicative only and can vary subject to the substrate used.
Technical data has been calculated according to BS EN 410 and BS EN 673. The above table has been updated to take into account the declared values of radiation and thermal properties required for CE Marking. Rw Value is indicative for PVB interlayer product only and will be subject to minor variations dependent upon the size of the glass panels and the number of fittings required.

Notes

Pilkington Planar™ Laminated IGUs are available with a selection of interlayers including PVF and Kuraray™ SentryGlas®. Silicone perimeter seals must be compatible with Pilkington Laminated Safety Glass.

A wide range of glass combinations and a choice of clear, translucent and coloured interlayers are available with laminated glasses. Please refer to Pilkington Architectural for advice.

In line with regulations applicable in many European countries, Pilkington Architectural recommend the use of laminated glass in overhead or sloping overhead glazing.

Specification – Pilkington Planar™ Laminated IGUs

COMPOSITION

Pilkington Planar™ Laminated IGUs are manufactured from an outer pane of Pilkington toughened and heat-soaked glass and one laminated inner glass (typically comprising 6 mm or 8 mm glasses). The use of heat strengthened or toughened glass in the laminate is dependent on the exact interlayer specification.

OUTER GLASS

Outer glass to conform to single Pilkington Planar™ specification.

INNER COMPONENT GLASSES

Thickness: 6 mm ±0.2 mm

Air space: 16 mm ±1 mm

Depth of silicone seal: Minimum 4 mm

Aluminium spacer depth: 7 mm

Sight line of unit edge seal: 12 mm min.

Spacer colour: Black or Natural

Laminated interlayer: 1.52 mm or 2.28 mm

There may be a step on each side up to 3 mm

Overall unit thickness: ±2 mm tolerance

GLASS SIZE – RECTANGLES

Maximum: 2500 x 5000 mm 0 + 4.5 mm

(Larger sizes upon request)

Minimum: 300 x 500 mm 0 + 4.5 mm

Aspect ratio: 14:1 Maximum for larger sizes

Diagonal tolerance: Up to 4 m 3 mm

Overall unit thickness: 58 mm (Larger on request)

Maximum weight: 1000 kg

SHAPE CAPABILITY

Rectangles and simple shapes. All tolerances will vary depending on the complexity of shape.

EDGE CONDITION

Smooth ground edges giving a flat profile with small ground arris. Shells or chips at edges will be ground out prior to toughening and do not constitute reason for rejection. Corners may be dapped. Some variation in edgetrack may be discernible on exposed edges where different machines and/or hand forming is a requirement for manufacture. Such variations shall be kept to a minimum. Where the detail of a structure is such that the double glazing edge sealant is fully exposed, minor undulations in the edge seal may be discernable, particularly near corners of the unit. Where a unit uses a Pilkington Planar™ Sun, Pilkington Suncool® or Pilkington Optitherm®, the coating will be edge deleted in the area of the unit edge to ensure maximum unit durability. Depending on product type, orientation and light conditions, the edge deleted area may be visible to the naked eye.

ARGON FILLING

It is generally accepted that Argon gas will slowly dissolve through the seals over a period of time, the rate of diffusion being dependent on several factors such as unit size and the environment in which it is glazed. The total retention of Argon in the unit cannot therefore be guaranteed for the life of the unit.

HOLE DRILLING – RECTANGLES

Diameters: 34 mm ±1 mm

48 mm ±1 mm

19 mm ±1 mm Countersunk

23 mm ±1 mm Countersunk (min. 12 mm outer glass)

Position: May be up to 67 mm from glass edge at corners and sometimes along edge, subject to confirmation.

Positional tolerance: ±2 mm from one datum point

Number of holes: Up to 10 (more on request)

INTERLAYERS AVAILABLE AS STANDARD

Kuraray “SentryGlas” or PVF.

To the fullest extent permitted by applicable laws, Nippon Sheet Glass Co. Ltd. and its subsidiary companies disclaim all liability for any error in or omission from this publication and for all consequences of relying on it.

CE marking confirms that a product complies with its relevant harmonised European Norm.

905 Fitting to Double Glazed Pilkington Planar™ Laminated IGUs

Pilkington Toughened and Heat Soaked Glass Mullion

Stainless Steel

905 Fitting

Laminated Inner Glass

Silicone Weather Seal

Stainless Steel Screw

TOUGHENING STRESS

10/12/15/19 mm glass: Pilkington Toughened and Heat Soaked Glass

6/8 mm glass:

Planar Toughened and Heat Soaked Glass

ROLLER WAVE

Mean roller wave: t ≤ 8 0.05 mm

t > 8 0.02 mm

Coated glass 0.05 mm

Maximum edge dip: 0.25 mm

Roller wave is usually parallel to the short side and in coated glass should be glazed horizontal where possible.

GLASS MARKING

Glass will be marked with the Pilkington toughening stamp and will show compliance with other regulatory requirements. The mark will be on each glass pane. Multiple panes will not necessarily be marked in the same corner. However, the thinner glasses will generally be marked with a relatively discreet linear band within the area of the unit edge seal.

HEAT SOAK TESTING

All toughened glass will be supplied heat soaked to or in excess of international specifications e.g. BS EN 14179.

LITESENTRY OSPREY SCANNER

A LiteSentry Osprey Scanner is used to monitor and ensure high quality aesthetics of the Pilkington Planar™ glass products.

VISUAL QUALITY – PVF

Advances in PVF technology in recent years have led to improved edge stability. Under natural exposure conditions, the edge of a PVF laminate will be of an acceptable quality when properly installed and maintained. However, the possibility of minor delamination cannot entirely be excluded. When viewed from a distance of 3 m in transmission and in the vertical position, bubbles, dirt or fibres within the laminate will be considered to be unacceptable if readily visible due to their size or quantity.

KURARAY SENTRYGLAS

This interlayer technology delivers increased load bearing characteristics and improved overall durability. Compared to standard conventional glass interlayers, SentryGlas® ionoplast is more resistant to moisture and the effects of weather due to its exceptional edge stability, with no defect extending greater than 3 mm normal to the chamfered edge of the laminate. Laminates will conform to the specification for process blemishes set forth in ASTM C1172-03, Table 1. When viewed from a distance of 3 m in transmission and in natural exposure conditions, the edge of a PVB laminate will be of an acceptable quality if readily visible due to their size or quantity.

DISTORTION

When laminating toughened or heat-strengthened glasses together, slight visible distortion in transmission due to small lensing effects may be noted at certain viewing angles. The phenomenon is not normally a problem in roof glazing but may be discernible in vertical glazing. In addition, the air in all sealed units expands and contracts in hot and cold weather causing the glass to bow out and in respectively, and this movement may be visible in reflection. On occasion, such effects can be increased by the specification of a coated glass within the unit. Site inspection should be from a distance of 3 m and at right angles to the glass.

INSTALLATION

Whilst the Pilkington Planar™ system is completely weatherproof, the components are not designed to be left in contact with water for extended periods, and adequate ventilation or drainage should be provided to allow the system to dry out periodically. Weather seals used around the periphery must be compatible with the Pilkington Planar™ system and approval from Pilkington Architectural should be sought prior to application.
